

DDG Louver Touch Up Program

For many years repairing the small chips in the dual Fluid bed coating on the louvers has not been properly executed reducing the life cycle of the coating to a 8-13 year period. When ACL's repair procedure's and training are followed the dual fluid bed louver coating could continuously look impressive and last 15 years. Following ACL's touchup technique will further enhance the already impressive 78 million the government has saved using the ACL Fluid Bed System. Investigation has shown previous vendors have not properly prepped the blemishes for touchup. Rust was not removed, feathering was not completed and it appears little or no tools were utilized to prepare the surface for touchup. Rust streams, fasteners and environmental fall out were also not properly addressed. There was inconsistent application of the top coat and no base coat (primer) appeared to be used. In conclusion repair to coating damage on the louvers has not properly been completed.

ACL's team of experts can train your ships force when to do the repairs and how to do them properly.

Prior practice shows poor & incorrect touchup techniques
